LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

Learning principles, guidelines, rules and practices for developing interactive software. Awareness of IDEs, technologies, tools and libraries for GUI development. Training software engineers to develop user centered systems.

After successfully passing this course the students will be able to:

- Knowhow and skills for designing and developing interactive software.
- Understand the basic principles of Human Computer Interaction.
- Comprehend the principles, rules and practices for software usability.
- Learn how to measure software usability.
- Become acquainted with principles and methods for designing interactive software systems of high usability.
- Learn how to evaluate interactive software systems.
- Learn about the software implementation architectures for User Interface development.

- Acquire knowledge regarding the various tools, IDE, libraries that are available for developing UI.
 - Understand the principles of interactivity in virtual reality.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking Others...

- Production of free, creative and inductive thinking
- Team work
- Search for, analysis and synthesis of data and information, with the use of the necessary technology
- Analysis of requirements for problem solving
- Working independently
- Ability to design, develop and evaluate user centered software systems.

SYLLABUS

- Introduction. Issues and examples.
- Defining and measuring usability.
- Learnability.
- Theories, principles and guidelines.
- Interaction styles.
- Specifying the interaction protocol.
- Design considerations.
- Development and assessment.
- Error recovery.
- Adaptive systems. Prototyping.
- Alternative interaction methods and virtual reality.
- GUI development tools. Libraries and tools for building GUIS: IDE, visual editors, GUI libraries, web GUI development frameworks, prototyping tools, 3D GUIs. Term project.

DELIVERY Face-to-face, Distance learning, etc.	Lectures, lab courses
USE OF INFORMATION AND COMMUNICATIONS TECHNOLOGY Use of ICT in teaching, laboratory education, communication with students	 Use of projector and interactive board during lectures. Course website maintenance. Announcements and posting of teaching material (lecture slides and

	 notes, programs). Announcement of assesse ecourse platform by UC Use of email and forum and improved commun Use of asynchronous platering (moodle) 	DI. s for information exchange ication with students.

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

This course aims to expose the students to Machine Learnings problems and applications and also to methodologies and tools for analyzing patterns and solve them. Basic notions of statistical pattern analysis, Bayesian analysis and inference methods, decision theory, neural networks and discriminant analysis are introduced. At the end of this course, students will be able to analyze complex data, to model simple and complex pattern recognition problems, to establish a parametric learning mechanism and to construct a decision support system. Also, they will display knowledge and understanding of the mathematical theory underlying the main classes of constrained (mainly) optimisation problems and the practical contexts in which such problems may arise.

Students develop methods and techniques for pattern recognition in the laboratory using (mainly) the Python and Matlab programming environment as well as . The objective is to design and understand basic and advanced methods for data processing and analysis such as:

- Statistical analysis of data
- Clustering: discovering and constructing groups of data

- Classification: building statistical decision support systems,
- Using Neural Networks, Support Vector Machines, and advanced deep learning methods
- Regression: constructing function approximation approaches, and
- Dimension reduction: transformation methods for data and selecting most important features.

Another direction is to discover the possibilities of all these methods as tools for data handling and knowledge extraction. For this purpose students either develop their own routines, or apply ready routines from Python and Matlab.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Project planning and management
Respect for difference and multiculturalism
Respect for the natural environment
Showing social, professional and ethical responsibility and
sensitivity to gender issues
Criticism and self-criticism
Production of free, creative and inductive thinking
Others

After successfully completing this course, the student is able to:

- Recognize pattern recognition problems and select algorithms and methodologies to solve them,
- Learn some of the traditional as well as the more recent tools for classification, clustering and regression problems,
- Construct a learning system to solve a given simple pattern recognition problem, using algorithms, tools and existing software,
- Read and comprehend recent articles in computer science and engineering-oriented pattern recognition journals, such as Journal of Machine Learning Research, Pattern Recognition, IEEE Transactions on Pattern Analysis & Machine Intelligence and Transactions on Neural Networks and Learning Systems,
- Get hands-on experience in using some of these techniques, through the homework assignments.

SYLLABUS

<u>Introductory concepts.</u> Bayes Decision theory, Bayes error, the normal multivariate distribution, discriminated analysis

<u>Classifiers</u>: linear functions and decision surfaces, perceptron algorithm. Nonlinear classifiers: Neural Networks, feedforward architectures, deep learning, convolutional neural networks, generalized linear classifiers, Support vector machines (SVM), Kernel-based classifiers.

<u>Regression</u>: linear regression and kernel-based regression models.

<u>Probability density estimation</u>: (non-parametric) Parzen-windows and k-nearest neighbors, and (parametric) unbiased estimator, likelihood function, maximum likelihood estimation, application on the general multivariate case, maximum a-posteriori estimation, Baeysian

estimators.

<u>Clustering techniques - Unsupervised learning</u>: clustering and applications, k-means algorithm and its extensions, Hierarchical (or tree-based) clustering, Spectral clustering, Probabilistic clustering with mixture models.

<u>Dimension Reduction</u>: Curse of dimensionality, Feature Extraction: Principal Component Analysis (PCA), Independent Component Analysis (ICA) and Linear Discriminant Analysis (LDA). Feature selection methods.

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

This course aims at introducing the basic principles, structures, algorithm and applications of information retrieval from document collections and the web.

After successfully passing this course the students will be able to:

- Apply appropriate pre-processing steps (including stop word removal, stemming, lemmatization, etc.) to construct indexes for information retrieval
- Build and use appropriate data structures (dictionaries, inverted indexes, etc) for efficient information retrieval from document collections
- Apply compression techniques
- Evaluate the results of information retrieval tasks using appropriate metrics such as relevance and precision.
- Combine various criteria for raking search results
- Use link analysis to improve the quality of results
- Understand how search engines work

• Design and implement information retrieval systems using appropriate tools

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking

Others...

- Production of free, creative and inductive thinking
- Search for, analysis and synthesis of data and information, with the use of the necessary technology
- Adapting to new situations
- Analysis of requirements for problem solving
- Algorithmic thinking
- Abstraction ability for problem modeling
- Working independently
- Team work

SYLLABUS

<u>Introduction to Information Retrieval</u>: basic concepts and applications, types of information retrieval systems, the Boolean model.

<u>Pre-processing and natural language processing</u>: document delineation, stemming, lemmatization, tokenization, stop-word removal

<u>Search queries</u>: phrase queries, proximity queries, tolerant retrieval, phonetic corrections, edit distance, k-gram indexes

<u>Information retrieval models</u>: the vector model, term frequency (tf), inverted document frequency (idf), the probabilistic model

Data structures: dictionary, inverted index, posting lists, Zipf's law, Heap's law, zone indexes

Compression: lossy and lossless compression, variable byte codes

<u>Evaluation:</u> relevance, precision, recall, precision/recall curve, mean average precision, discounted cumulative gain, kappa statistics

<u>Implementation issues:</u> term-at-a-time, document-at-a-time retrieval, parallel retrieval, result summarization, the Lucene system.

Search Engines: link analysis, PageRank, HITS, advertisements

 Guidelines for writing Learning Outcomes

The main objective of this course is the study and application of best practices, patterns and refactoring techniques that allow to avoid issues of poor software design/implementation The main outcomes of the course is that the students will be capable to:

- Identify issues of poor software design/implementation.
- Improve the quality of software that suffers from issues of poor software design/implementation by applying refactoring techniques.

General Competences				
Taking into consideration the general competences that t	he degree-holder must acquire (as these appear in the Diploma

- Ability to abstract and model problems.

SYLLABUS

This course focuses on issues related to the development of clean software. More specifically, the course consists of the following parts.

Fundamental principles, conventions, standards, and best practices for the development of clean code: Basic concepts, naming (conventions, standards and best practices for naming selection), comments (types of good/bad comments, conventions, standards and best practices for writing comments), formatting (properties of horizontal formatting, properties of vertical, code density, code transparency, formatting conventions, standards and best practices), source code organization (properties of clean functions, properties of clean classes, conventions, standards and best practices for the implementation of clean code), principles of object-oriented design (dependency inversion, open close principle, single responsibility principle, interface segregation, etc.), error handling issues.

Software refactoring: Basic concepts, design and code smells, refactoring techniques for the composition of methods, refactoring techniques for the simplification of conditional logic, refactoring techniques to improve responsibility assignment, refactoring techniques for generalization/specialization, advanced refactoring techniques, refactoring to patterns.

The course also comprises a project that aims at the development of a large software system in groups of 2-3 students. The project consists of two phases. The goal of the 1st phase is the development of an initial version of the software system, while the goal of the 2nd phase is to refactor the outcome of the 1st phase. The objective of the project is to train the students in the use of integrated development environments and refactoring.

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The primary aim of the course is to convey an understanding high-performance architecture of processor and the memory hierarchy

After successfully passing this course the students will be able to:

- Describe the structure and operational characteristics of a pipelined microprocessor.
- Demonstrate an understanding of pipeline hazards and interlocks, out-of-order execution, scoreboards and reservation tables, branch prediction
- Evaluate the performance of a processor and memory system.
- Describe the memory coherency issues involved when designing a multiprocessor system, and explain the behaviour of a typical cache coherency protocol.
- Adapt existing simulators, run simulations and present a critical evaluation of the results.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking

- Production of free, creative and inductive thinking
- Search for, analysis and synthesis of data and information, with the use of the necessary techniques

Others...

- Algorithmic thinking
- Use abstraction to understand and analyze complex systems/problems
- Working independently
- Adapting to new situations
- Communicate information, ideas, problems and solutions to experts in the field

SYLLABUS

<u>Introduction</u>: Performance measurement. Energy consumption metrics. Reliability metrics. Benchmark programs.

<u>Pipelined processor organization:</u> Instruction dependencies, pipeline hazards, data forwarding, pipeline stall, delayed branches. Code scheduling.

<u>Instruction-level parallelism</u>: Dynamic/static superscalar processors. Dynamic scheduling. . Out of order execution. Speculative execution. Branch prediction.

<u>Memory subsystem</u>: memory technology. Organization and operation of cache memories. Performance evaluation of cache memory. Virtual memory, fast memory address translation, virtually/physically addressed caches.

<u>Parallel</u> systems: Shared-memory multicore systems. Memory coherence, memory consistency.

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The course provides an introduction to wireless networks and their applications. It first discusses the fundamental properties of wireless transmission in order to illustrate the need for specialized networking protocols and technologies. A wide range of wireless networks, extending from wireless local area networks to cellular systems, are presented and analyzed in order to: a) provide theoretical as well as practical information on of state-of-the-art wireless technologies, b) analyze the differences compared to traditional wired networking, and c) explain the challenges in building a wireless network.

After successfully passing this course the students will be able to:

- understand the communication paradigms that necessitate the use of wireless networks.
- understand the challenges and the limitations in designing wireless networks imposed by wireless transmission and user mobility.
- explain how wireless networking protocols are different from wired ones.
- be able to identify the most significant types of wireless networks and the

	corresponding networking princip	ples.				
•	understand and be able to describe how most well-known wireless networking					
	protocols work.					
•	choose the optimal parameter setting for a wireless network in order to achieve					
	the desired performance.					
•	choose and combine known wire	eless networking concepts for creating a network				
	that meets specific performance	requirements.				
•	understand new trends and the c	hallenges in wireless networking.

SYLLABUS

Introduction to wireless networking. Overview of the history, evolution, and compatibility of wireless standards. The special problems of wireless and mobile computing. Wireless transmission: Free space path loss, Path loss models, Noise, Interference, Antennae (antenna types, antenna gain), Multipath fading, Diversity techniques. Modulation: Analog and Digital Modulation techniques. Spread Spectrum Techniques: Direct Sequence SS, Frequency Hopping SS. Cellular Networks: Architecture, Frequency allocation, Handover, GSM-based networks, Evolution of Cellular networks. Satellite Networks. Wireless Local Area Networks: Application scenarios, Network types (infrared, microwave, spread spectrum), Standardization (Bluetooth, IEEE 802.11, HIPERLAN). IEEE802.11 Networks: Physical layer, Infrastructure and ad-hoc networks, Medium Access Control (DCF and PCF), Mobility management, Security, IEEE 802.11e. Mobile Internet protocol.

This course aims to teach students basic cryptographical methods, principles of systems and software security, secure protocols for the Internet and the web, develop hands-on experience in software and network attacks.

At the successful completion of the course, the student is expected to:

- Learn basic methods and applications of symmetric and public-key cryptography.
- Understand computer systems security and access control.
- Get familiar with web security and distributed authentication.

Get	hands-on	experience	with	buffer	overflow	and	network	attacks.

 Guidelines for writing Learning Outcomes

Optimization is the branch of Mathematics that deals with the detection of optimal solutions of parametric function. In this course, we study methods for various types of local and global optimization problems such as the following:

- 1. Gradient-based methods: gradient descent, Newton, quasi-Newton, conjugate gradients, in combination with line search and trust region techniques.
- 2. Derivative-free methods: Nelder-Mead, Hooke-Jeeves, pattern search.
- 3. Stochastic and evolutionary algorithms for global optimization: random search, simulated annealing, genetic algorithms, particle swarm optimization.

After successful completion of this course, students are expected to be able to:

• Implement and apply local and global optimization algorithms.

- Determine the most appropriate algorithm for a given problem.
- Design variants of the algorithms for serial and parallel computing environments.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and	Project planning and management
information, with the use of the necessary technology	Respect for difference and multiculturalism

- Guidelines for writing Learning Outcomes

Introduction to basic VLSI testing principles and architectures. The course aims to make students familiar with modern testing and design for testability practices. The students understand VLSI testing challenges and learn how to apply proper design techniques to improve testability and enhance reliability in nanometer technology electronics systems At the end of this course, students will be able to analyze electronic system testing requirements and develop simple testing solutions to support systems reliability.

After taking this course students will be able to:

- Understand automatic test pattern generation and fault simulation principles.
- Analyze electronic system testing requirements.

- Combine design for testability techniques and apply them in electronic systems.
- Develop scan testing and BIST solutions.
- Synthesize on-line testing schemes.
- Understand the basic fault generation mechanisms in IC's, the basic fault models and the basic testing algorithms.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas	Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking Others
Production of new research ideas	Others

- Production of free, creative and inductive thinking
- Search for, analysis and synthesis of data and information, with the use of the necessary technology
- Abstraction ability for problem modeling
- Working independently
- Team work

SYLLABUS

Introduction and challenges in VLSI testing. Automatic test pattern generation. Fault simulation. Design for testability (DfT). Scan testing and architectures (full scan, partial scan, at-speed scan testing). Built-in self testing – BIST (pattern generation, output response analysis, architectures). Logic diagnosis. On-line testing.

The students understand design for testability techniques through lab exercises which include the following topics:

- 1. Understanding of basic Fault Models.
- 2. Test Pattern Generation and Fault simulation.
- 3. Familiarization with scan testing schemes.
- 4. Development of built-in self test architectures.
- 5. Design DfT schemes and apply them to electronic systems.
- 6. Fault models, defect types and test algorithms for memory IC's.

Data mining refers to the extraction of knowledge from large quantities of data. This course aims at introducing the students to basic and advanced concepts, algorithms and tools of Data Mining, and give them hands on experience with the analysis of real data using state-of-the-art tools.

After successfully passing this course the students will be able to:

- Understand the main concepts and problems involved in Data Mining.
- Understand algorithmic data mining techniques and utilize them to design algorithms for solving practical problems.
- Understand the theoretical underpinnings and the mathematics behind the Data Mining techniques, and utilize them to analyze the theoretical properties of data mining algorithms.
- Utilize state-of-the-art data mining tools for implementing data mining algorithms.

- Deal with the requirements and challenges of analyzing large amounts of real data.
- Solve new data mining problems using the algorithms, theory and existing tools.
- Design and develop a data mining pipeline for large data analysis.
- Think about new problems and solutions in data mining.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and	Project planning and management
information, with the use of the necessary technology	Respect for difference and multiculturalism

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

This course aims at introducing to students the fundamentals of VLSI circuit analysis, synthesis, design and simulation.

After successfully passing this course the students will be able to:

- Understand manufacturing technologies of nanometer integrated circuits.
- Understand logic circuit operation at the transistor level.
- Analyze simple or complex digital circuits.
- Synthesize digital circuits at the transistor level.
- Solve performance related problems in VLSI circuits.
- Design and simulate VLSI circuits, perform measurements on their characteristics and verify their performance.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma
Supplement and appear below), at which of the following does the course aim?Search for, analysis and synthesis of data andProject planning and management

information, with the use of the necessary technologyRespect JAdapting to new situationsRespect JDecision-makingShowingWorking independentlysensitivityTeam workCriticismWorking in an international environmentProductionWorking in an interdisciplinary environment.....Production of new research ideasOthers...

Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking Others

- Production of free, creative and inductive thinking
- Search for, analysis and synthesis of data and information, with the use of the necessary technology
- Adapting to new situations
- Analysis of requirements for problem solving
- Abstraction ability for problem modeling
- Combination of existing methods for the synthesis of high performance circuits
- Working independently
- Team work

SYLLABUS

MOS transistor theory. CMOS technology and integrated circuit manufacturing. CMOS combinational circuit design, complex gates and logic families (static, dynamic, Domino, CVSL, pass transistor logic). Sequential circuits. Circuit characterization and performance estimation. Logical effort. Interconnect, clocking strategies and power consumption. Clock and power distribution techniques. Sub-circuit design (adders, counters, multipliers, memories, data paths). Placement and routing. Floor-planning. FPGAs. Memory organization. VLSI testing and design for testability techniques.

DELIVERY Face-to-face, Distance learning, etc.	Face-to-face, lectures, lab courses, home-works	
USE OF INFORMATION AND COMMUNICATIONS TECHNOLOGY Use of ICT in teaching, laboratory education, communication with students	 Use of e-slides and interactive board during lectures. Use of computer-aided design tools at the laboratory (circuit design and simulation). Use of components and instruments (signal generators, power supplies, multi-meters, oscilloscopes) at the laboratory for circuit implementation and measurement. Ecourse website maintenance. Course website maintenance. Announcements and posting of teaching material (lecture slides and notes). Use of email for information exchange and

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

Almost all modern computing systems are parallel, with multiple processors or cores, which can work concurrently towards the solution of a problem. This course is an introduction to the organization and operation of parallel computers and to their architectural categories. An engineer should know the problem which appear and the solutions he/she can give, as well as judge the appropriateness of the techniques involved. In addition, the course teaches parallel programming which is a highly sought qualification. The general parallel programming knowledge is complemented with actual programming assignments which utilize the most important parallel programming models.

After successfully passing this course the students will be able to:

- Study and understand the organization of a parallel computer.
- Analyze the pros and cons of architectural choices.
- Synthesize the organization of a parallel system.

- Understand the problems of the memory hierarchy, cache coherency and memory consistency.
- Understand and analyze the topology, the switching scheme and the routing protocols in processor interconnection networks.
- Synthesize parallel software.
- Program in the shared address space model using threads and OpenMP
- Program in the message passing model using MPI
- Program GPUs using OpenMP, CUDA
- Analyze the performance of a parallel system.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking

Others...

- Working independently
- Production of free, creative and inductive thinking
- Search for, analysis and synthesis of data and information, with the use of the necessary technology
- Project planning and management
- Adapting to new situations

SYLLABUS

- Basic principles of parallelism
- Shared memory organization
- The problems of cache coherency and memory consistency
- Distributed memory organization
- Interconnection networks, topologies, routing, high-performance switching
- Distributed shared memory and non-uniform memory access
- Multicore architectures
- SIMD and GPU organizations
- Principles of parallel programming
- Programming in the shared address space model (threads, OpenMP)
- Programming in the message passing model (MPI)
- GPU programming (OpenMP, CUDA)
- Performance analysis (speedup, efficiency, cost, scalability)

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The objective of the course is the introduction of the student to the compression and transmission of multimedia signals, with emphasis on images, video, and audio. It is expected that, at the end of the course, the student will be able to:

• Understand the basic principles of signal compression.

- •Understand and use the current standards for image, video, and audio compression.
- •Know the basic error resilience and error concealment techniques for video.
- •Understand the techniques for video transmission over networks

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and	Project planning and management

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The objective of the course is to acquaint students with:

- More elaborate use of fundamental techniques for the design and analysis of algorithms and data structures.

- Advanced techniques for the design and analysis of algorithms and data structures.
- Mathematical tools such as probabilistic analysis, amortized analysis, and competitive analysis.
- Important algorithms and data structures for fundamental problems.
- Topics in computational complexity, approximate solutions, and randomization.

Students who complete the course successfully learn to:

- Apply advanced techniques for the design and analysis of algorithms and data structures.

- Provide appropriate mathematical models for various problems.

- Compare the efficiency and suitability of different algorithms and data structures

for solving specific problems.

- Recognize in which of the basic complexity classes (e.g. P, NP) a specific problem belongs to.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking

Production of free, creative and inductive thinking

• Search for, analysis and synthesis of data and information, with the use of the necessary technology

Others...

- Algorithmic thinking
- Abstraction ability for problem modeling
- Working independently
- Team work
- Working in an international environment

SYLLABUS

Selected topics from the following areas: Network optimization problems: Algorithms (shortest paths, maximum flows, connectivity, maximum matchings, minimum-cost flows) and related data structures (Fibonacci heaps, dynamic trees). Randomized algorithms (shortest paths, minimum spanning trees, minimum cuts, random walks, Markov chains, universal hashing). Algorithms and data structures for external memory. Number theoretic algorithms (cryptosystems, primality testing). Online algorithms (list accessing, paging, load balancing). NP-hard problems and approximation algorithms (heuristic methods, linear programming and rounding).

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The goal of the course is twofold: one the one hand, the first goal is to present advanced topics of database management and on the other hand, a second goal concerns the handson experience of students with the design and implementation of a data-centric information system. Concerning the first goal, the students are presented with the software architecture of a Database Management System (DBMS) along with the techniques, theoretical foundations and algorithms used by DBMSs for their three fundamental tasks: query processing, concurrency control and recovery from failures. Concerning the programming part, the students are exposed via a project to the design and implementation of an information system with a relational DBMS as its back-end and a graphical user interface on the front-end.

The expected outcomes of the course include the following skills for a successful student:

- The ability to tune the queries submitted to a DBMS with the goal of efficiency

- The ability to tune the concurrency control and the recovery from failures with the goals of data integrity and efficiency The ability to tune the design of a database with the goals of data integrity and efficiency in performance The ability to design and implement a complete information system with a relational DBMS back-end and an interactive GUI as a front-end **General Competences** Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim? Search for, analysis and synthesis of data and Project planning and management information, with the use of the necessary technology Respect for difference and multiculturalism Adapting to new situations Respect for the natural environment Decision-making Showing social, professional and ethical responsibility and Working independently sensitivity to gender issues Team work Criticism and self-criticism Working in an international environment Production of free, creative and inductive thinking Working in an interdisciplinary environment Others ... Production of new research ideas
 - Production of free, creative and inductive thinking
 - Search for, analysis and synthesis of data and information, with the use of the necessary technology
 - Team work
 - Algorithmic thinking
 - Abstraction ability for problem modeling
 - Design & implementation of data intensive information systems

SYLLABUS

<u>Architecture of a Database Management System</u>. Processes, memory structures and data storage. Internal architecture of a DBMS.

<u>Query processing</u>. The general context of query processing. Algebraic operators and algorithms for their implementation (selection, join, aggregation).

<u>Query Optimization</u>. Query optimization space. Left-deep trees. Dynamic programming for query optimization.

<u>Transactions and concurrency control in databases</u>. Concurrency problems and transaction correctness. Serializability. Serializability graphs. Locks. The 2 Phase Locking Protocol. SQL Isolation levels.

<u>Recovery from failures</u>. Log files. Write-ahead Logging. Algorithms for recovering from failures.

Physical design and tuning of databases. Indexing. Partitioning. Query rewriting.

Security and access control for databases.

<u>Data warehouses</u>. General architecture of data warehouses. OLAP. ETL. Star & Snowflake schemata. Query processing in data warehouses

Implementation of a sizeable project, concerning an information system, built on top of database.

TEACHING and LEARNING METHODS - EVALUATION

DELIVERY Face-to-face, Distance learning, etc.	Lectures, lab courses	
USE OF INFORMATION AND COMMUNICATIONS TECHNOLOGY Use of ICT in teaching, laboratory education, communication with students	 Use of projector and interactive board during lectures. Use of computer for demonstation of programming. Use of computers in laboratories for development and testing of programs. Course website maintenance. LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B

• Guidelines for writing Learning Outcomes

The main course objectives are to:

- Offer an introduction to theoretical and practical aspects on the design and modeling of robotic systems, on the trajectory generation, as well as on the analysis and control of classical robotic mechanisms.
- Bring students closer and make them familiar with mathematical tools for studying robotic mechanisms and offer a comprehensive analysis to the usability and functionalities of robots in our daily life.

A student that successfully attends this course should be able to:

- Understand basic topics in the theory and practical implementation of robotics.
- Understand the basic functionalities of a typical robotic platform as well as the mathematical models for modeling the motion and behavior of robots.

• Study and solve simple problems in robotic manipulation, dynamic behavior and trajectory generation.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and	Project planning and management
information, with the use of the necessary technology	Respect for difference and multiculturalism
Adapting to new situations	Respect for the natural environment
Decision-making	Showing social, professional and ethical responsibility and
Working independently	sensitivity to gender issues
Team work	Criticism and self-criticism
Working in an international environment	Production of free, creative and inductive thinking
Working in an interdisciplinary environment	
Production of new research ideas	Others

- Search for, analysis and synthesis of data and information, with the use of the necessary technology.
- Decision-making.
- Team work.
- Working in an interdisciplinary environment.
- Production of free, creative and inductive thinking.
- Abstraction ability for problem modeling.

SYLLABUS

Introduction: History, robot structure and categories, position and orientation.

<u>Kinematics</u>: Direct kinematics, inverse kinematics, differential kinematics, Jacobian matrices, singularities, work space, statics, kinematics of mobile robots.

<u>Dynamics</u>: Acceleration of a rigid body, manipulator dynamics, dynamics of a mobile robot, Lagrangian formulation, simulation.

<u>Trajectory and motion design</u>: Trajectory generation, trajectories in joint-space, trajectories in Cartesian-space, motion design of mobile robots.

<u>Control of robotic systems</u>: Actuators and sensors, position control, programming and simulation software for robotic systems (ROS, Octave).

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

This course aims at first to provide a general description of computational intelligence problems and methods. Then the emphasis is given to artificial neural network methods and applications. The main course objective is to provide understanding of the learning from data paradigm as a general methodology for solving real-world problems. The most successful neural network models and learning algorithms are presented for supervised learning (classification, regression) and unsupervised learning (clustering, topographical mapping) problems. Moreover, a clear understanding of the notion of generalization and the typical methods used for model order selection constitute another important objective of this course.

It is expected that after taking the course the student will have:

- deep knowledge of the learning from the data problem solving paradigm
- a clear understanding of the various categories of learning problems
- a clear understanding of the notions of generalization and overtraining

 the ability to solve classification, regression and clustering problems using neural network methods 				
General Competences Taking into consideration the general competences that t Supplement and appear below), at which of the following	he degree-holder must acquire (as these appear in the Diploma does the course aim?

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The course objective is to formally define the notion of computational problem, introduce basic models of computation such as Turing Machines, show that there exist problems that are unsolvable, define time and space requirements of a Turing Machine, introduce nondeterminism, classify solvable problems in complexity classes and investigate the relations between these classes.

A student that successfully attends the course will know:

- what a computational problem is
- some basic models of computation
- how we can give a formal definition for the informal notion of a computable function
- that there exist computational problems that are unsolvable
- that there exist solvable problems that are intractable
- how to prove that a problem is unsolvable using diagonalization or reduction.

- how to prove that a problem is intractable using polynomial time reduction.
- some basic complexity classes and the relations between them.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking

Others...

- Adapting to new situations
- Working independently
- Production of free, creative and inductive thinking
- Decision-making

SYLLABUS

Computational problems and formal languages. Primitive recursive functions.

Recursive functions.

Turing machines and equivalent models of computation.

Church's Thesis.

Kleene normal form.

Unsolvability.

Recursive and recursively enumerable sets.

The arithmetic hierarchy.

Non-deterministic Turing machines.

Complexity classes.

The classes P, NP and PSPACE.

Reductions and Completeness.

NP-complete problems.

Grammars and the Chomsky Hierarchy.

 Guidelines for writing Learning Outcomes

The course aims to introduce the students to digital images and their applications. At first, the relation between image processing and image analysis, which usually follows processing, is described. Then, the course is divided into two parts concerning these fields. In the first part of the course, an extension of 1D fundamental topics to 2D is presented (sampling, convolution, Fourier transform, DFT and circular convolution) and the operation of filtering in the spatial and frequency domains is thoroughly analyzed. The student is also introduced to noise removal as well as to computerized tomography through the Radon transform and the filtered backprojection reconstruction of sinograms. The usefulness of Töplitz and circulant matrices is underlined, as well as how these are involved in the formulation of linear and circular convolutions and their application to developing advanced filters (regularized least squares filter, Wiener filter). The student is also introduced to colour spaces and the colour reproduction. Finally, the student is given an overview of 1D and 2D wavelet transform.

The second part of the course consists of an overview of image analysis techniques such as morphological image processing, image segmentation, region representation and an introduction to object recognition using classifiers.

Care is taken to introduce methods and models that have proven quite useful in the recent

Significant attention is given to guide the students to program the algorithms presented in			
the lectures.			
It is expected that the student after attendi	ng the course will be able to:

SYLLABUS

Introduction to digital image processing. Elements of visual perception. Sampling and quantization.

Intensity transformations, histogram processing, spatial filtering, smoothing and sharpening filters. Frequency filtering, 2D sampling, 2D Fourier Transform. Aliasing. The 1D and 2D Discrete Fourier Transform (DFT).

DFT expressed in matrix form. The Fourier matrix. Convolution, Töplitz and circulant matrices.

Image restoration, noise models. Normalized least squares filter, Wiener filter.

Colour image processing, colour models, smoothing and sharpening colour images, chromaticity diagram.

Morphological image processing, erosion and dilation, opening and closing.

Image segmentation, image features, feature extraction, image descriptors. Colour, shape, texture features. Fourier descriptors, radial descriptors. Histogram descriptors, Gabor filters, Local Binary Patterns. Image retrieval and image recognition.

Gaussian and Laplacian Pyramids, multiscale analysis, scale-invariant feature transform. SIFT keypoint detection and description. SIFT applications. Other SIFT-like descriptors. The RANSAC algorithm. Image matching, image mosaicking, panorama stitching. Image retrieval, Keyword spotting, object detection.

Discrete Wavelet Transform, Haar wavelets.

Radon transform, the Fourier-slice theorem. Reconstruction from filtered back-projections.

Pattern Recognition and Machine Learning in digital image processing. Convolutional Neural Networks (CNNs) and Deep Learning in image processing.

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

This course aims at introducing to students management techniques for complex data used in extended database systems. The focus is on indexing such data in order to efficiently search and analyse them. The data types examined include spatial data, data on spatial networks, multidimensional data, set-valued data, data on graphs, multimedia data and time-series.

After successfully passing this course the students will be able to:

- Understand the types and sources of complex data
- Understand how the relationships, the distance, and the similarity between data is defined in different spaces (e.g., Euclideand, metric spaces, graphs)
- Express queries on complex data
- Apply search and analysis techniques on complex data
- Design extensions of relational database systems that manage complex data

• Design imdexing methods and search algorithms for complex data

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking

Production of free, creative and inductive thinking

• Search for, analysis and synthesis of data and information, with the use of the necessary technology

Others ...

- Adapting to new situations
- Analysis of requirements for problem solving
- Algorithmic thinking
- Abstraction ability for problem modeling
- Working independently
- Production of new research ideas

SYLLABUS

<u>Advanced topics on managing relational data:</u> relational data, query languages, indexing, query evaluation, query optimization.

<u>Spatial data:</u> storing spatial data in databases, spatial relationships, spatial queries, the R-tree, spatial query evaluation, nearest neighbor queries, spatial joins.

<u>Spatial networks</u>: data on spatial networks, distance in spatial networks, storage of network and data, indexing, shortest path search, spatial queries on networks, precomputation techniques.

<u>Multidimensional data:</u> multimedia data, feature vectors, collections of multidimensional data, indexing, dimensionality reduction, similarity queries, time-series, containment queries on time-series, indexing time-series, dynamic time warping.

<u>Top-k and skyline queries:</u> multidimensional data, top-k query variants, top-k query evaluation, indexing for top-k queries, top-k joins, dominance between multidimensional points, skyline queries, skyline computation on raw data, skyline computation on indexed data.

<u>Set-valued data and text</u>: document databases, containment and similarity queries on text, indexing set-valued data, signature files, inverted files, query evaluation, string matching, suffix trees and arrays, approximate string matching, edit distance computation.

<u>Geo-textual and geo-social data</u>: queries on geo-textual data, query evaluation, indexing, distance between social network nodes, PageRank, Personalized PageRank, query evaluation on geo-social data.

TEACHING and LEARNING METHODS - EVALUATION

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The course provides an introduction to wireless propagation and the principles of designing wireless links. The course aims at providing students with the knowledge required to understand all the phenomena related to wireless propagation as well as to provide them with the basic principles used to design a wireless link in the context of wireless communications.

After successfully passing this course the students will be able to:

- understand the challenges and the limitations imposed by wireless propagation in designing wireless link
- explain how wireless link is different from a wired one
- be able to identify and explain the phenomena related to propagation and qualitatively evaluate the performance of a wireless link.
- estimated the impact of several parameters on the link performance

• solve typical link budget problems

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking Others...

- Production of free, creative and inductive thinking
- Search for, analysis and synthesis of data and information, with the use of the necessary technology
- Analysis of requirements for problem solving
- Algorithmic thinking
- Abstraction ability for problem modeling
- Working independently
- Team work

SYLLABUS

The course examines fundamental principles of propagation loss and focuses on designing a wireless link budget. The main area covered are:

- Fundamental principles of wireless propagation
- Wireless propagation modelling
- Analytical propagation loss models
 - o Flat earth loss
 - o Two ray model
 - Diffraction loss
 - o Fresnel zones
 - Link Budget
- Empirical propagation loss models
 - Outdoor models (Okumura Hata, Egli, IEEE, ITU-R P1546, WINNER)
 - Indoor models (COST 231, ITU-R P1238)
- Wireless Link Fading
 - Small scale fading
 - o Large scale fading
 - Empirical determination of path loss

LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

This course aims to help students:

- understand the principles of effective teaching and teaching IT in Primary and Secondary Education
- learn teaching methods for use in subjects on general algorithms and programming
- learn innovative methods for teaching programming
- learn about software used for IT in Primary, Middle School, High School/Lyceum and Professional Lyceum.

After taking this course students will be able to:

- effectively plan teachings for Computer Science and Informatics topics using worksheets.
- design and implement teaching scenarios on IT in a school environment (Primary and Secondary Education).
- use and integrate educational software into the teaching process.

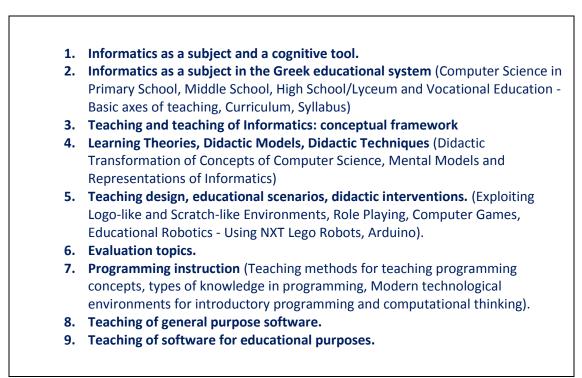

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

Search for, analysis and synthesis of data and information, with the use of the necessary technology Adapting to new situations Decision-making Working independently Team work Working in an international environment Working in an interdisciplinary environment Production of new research ideas Project planning and management Respect for difference and multiculturalism Respect for the natural environment Showing social, professional and ethical responsibility and sensitivity to gender issues Criticism and self-criticism Production of free, creative and inductive thinking Others...

This course aims at introducing to students the fundamentals of electronic circuit analysis, synthesis, design, simulation, implementation and measurement.

After successfully passing this course the students will be able to:

- Understand manufacturing technologies of nanometer integrated circuits.
- Understand logic circuit operation and physical implementation (layout) at the transistor level.
- Analyze simple or complex analog circuits.
- Synthesize analog circuits at the transistor level.
- Design and simulate basic analog electronic circuits.
- Implement analog electronic circuits in schematic and layout level, measure their

characteristics and verify their performance after parasitic extraction.

General Competences

Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

 Guidelines for writing Learning Outcomes

The goal of the course is the students:

- to know workplaces, where they get in touch with current market developments, to give them the opportunity to acquire new knowledge, to participate actively in teamwork and decision making, to develop their skills, to participate in design and finish projects and to have a first full working experience
- to transfer their knowledge and experience to the companies and the opposite, with the aim of upgrading the studies at the Department and maintaining the high level of knowledge provided

Finally, Practical Training strengthens the department's relationships with stakeholders and the local community and creates job opportunities for its graduates.

SYLLABUS

Practical Training of students is part of the Department's Undergraduate Program of Studies since its approval by the General Assembly of the Department of Computer Science (4 November 1998). Practical Training has been incorporated as an elective course. Students may participate by completing the sixth (6) semester of study and must have over than 120 ECTS at the time of application (which is the 2/5 of the ECTS required to obtain the diploma). The duration of the Practical Training is 2 months. Each student can participate once. The selection of students is based on criteria set by the Department's Practical Training Committee. Specifically the selection is made considering

- the student's average rating
- the student's ECTS credits at the time of the application
